Arch. Biochem. Biophys. 241:684-691(1985).
-!-PUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completel-into an extensible 3D network.
-!-SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.
-!-SUBCELULIAR LOCATION: Extracellular matrix of elastic fibers.
-!- PTM: The crosslinks are made of deaminated Lys.

"Isolated supravalvular aortic stenosis: functional haploinsufficiency of the elastin gene as a result of nonsense-mediated decay.";
Hum. Genet. 106:577-588 (2000).
-!- FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.
-!- SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.
                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUE-Skin fibroblast,

|-- D18EASB: Defects in ELN are a cause of autosomal dominant cutis laxa [MIM:123700]. Cutis laxa is a rare connective tissue disorder characterized by loose, hyperextensible skin with decreased resilience and elasticity leading to a premature aged appearance. The skin changes are often accompanied by extracutaneous manifestations, including pulmonary emphysema, bladder diverticula, pulmonary artery stenosis and pyloric senosis.
|-- D15EASE: Haploinsufficiency of ELN may be the cause of certain cardiovascular and musculo-skeletal abnormalities observed in Williams-Beuren syndrome (WBS) [MIM:194050]. WBS is a rare developmental disorder and a contiguous gene deletion syndrome involving genes from chromosome band 7q11.23.
|-- D15EASE: Defects in ELN are the cause of supravalvular aortic stenosis (SVAS) [MIM:185500]. SVAS is a congenital narrowing of the ascending aorta which can occur sporadically, as an autosomal dominant condition, or as one component of Williams-Beuren

"Rat tropoalastin is synthesized from a 3.5-kilobase mRNA.";
J. Biol. Chem. 263:13504-13507(1988).
-! FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.
-! SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.
-! SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
                                                                                                                                                                                                                                             Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

-!- FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.

-!- SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.

-!- SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.

-!- ALTERNATIVE PRODUCTS:
